MIRROR

Super lightweight and safe DPS MIRROR

DPS Mirror is a wide range of light and safe mirror panels, consisting of shrinkable membrane stretched on an aluminum frame. Modules are produced for individual order, in various sizes and shapes. They are successfully used in public, commercial and private spaces.

QUALITY AND SAFETY

DPS Mirror panels have been created to replace traditional mirrors, which for safety reasons should not be mounted on the ceiling. DPS Mirror modules have up to 98% optical reflection, thanks to which they reflect the image better than standard glass mirrors.

The modules weigh about 1,5 kg/m², do not break, have CE certificate and fire class B-s1,d0.

MIRROR COLOUR

Coloured mirrors are an elegant and modern decorative element which is used in many interiors. One of the main advantages is their ability to create unusual visual effects that can change the character of a room. Coloured mirrors can reflect light in various shades, which adds depth and dynamics to the space, creating a unique atmosphere.

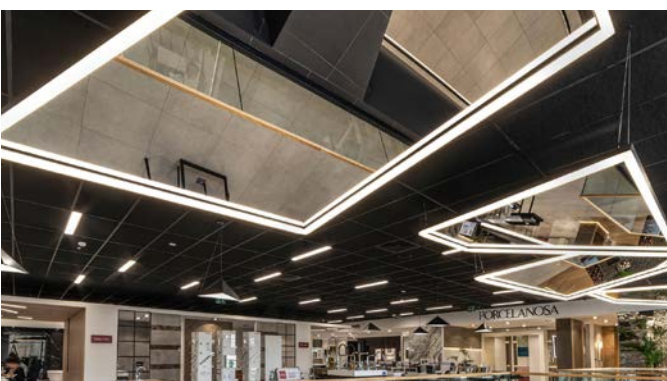

The rich colour palette includes, among others: gold, blue, black or copper colour.

MIRROR ANTIQUE

DPS Mirror panels can imitate old, time-worn mirrors, thanks to which they become an element of the unique atmosphere of stylish interiors. Their purpose is diverse - shops, galleries, stylized apartments, as well as museums and themed exhibitions.

The effect is achieved by printing a mirror membrane, which also allows you to apply any graphics to the panel. It is a perfect decorative element that complements our collection.

MIRROR ACOUSTIC

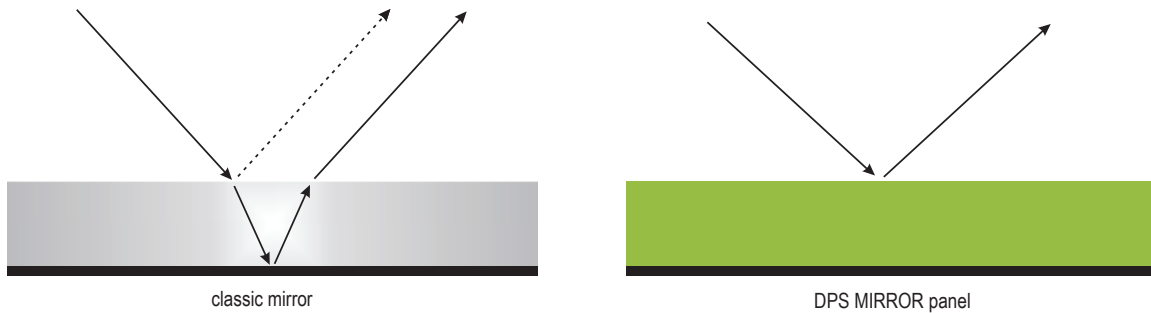

Product intended for rooms where it is required to improve acoustic conditions and local, targeted elimination of acoustic reverberation (e.g. living room, office, or open space office).

DPS Mirror acoustic panels have a reverberation reduction coefficient of $\alpha_w=0,75$ and acoustic class C.

Advantage of the DPS MIRROR over the classic mirror

BETTER VERSION OF THE MIRROR

DPS Mirror panels are characterized by a degree of reflection of up to 98%, while in the case of a standard glass mirror, the degree of reflection is only about 70%. So we can definitely say that DPS Mirror is a better version of a mirror.

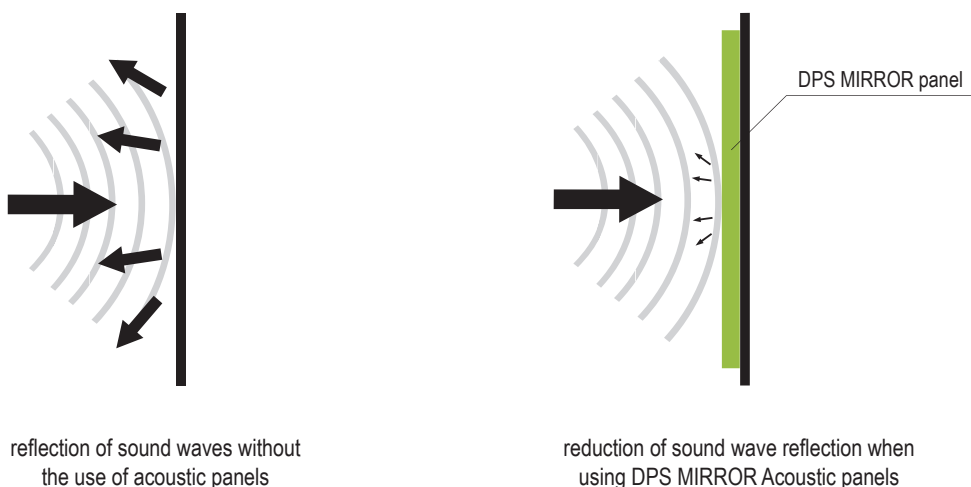

QUICK INSTALLATION

Installing DPS Mirror panels is extremely quick and easy. Links and magnets allow for easy and precise placement of panels in the selected place, which significantly shortens the assembly time compared to traditional methods, which often require complex tools and longer working time.

Safety is another important advantage of this type of installation. Neodymium magnets are characterized by a very high attractive force, which guarantees stable and secure holding of the panels in place. At the same time, the ability to easily dismantle the panels without damaging the walls or the mirror itself makes it a safe option both during installation and subsequent arrangement changes.

IMPROVEMENT OF ACOUSTICS

Mirror acoustic panels with a sound absorber layer invisible to the recipient are an innovative solution that combines functionality with elegant design, bringing benefits both in terms of improving the acoustics and aesthetics of rooms. The effects of using mirror acoustic panels with a sound absorption parameter of $\alpha_w=0.75$ ensure better speech intelligibility, which is crucial in environments where conversations and presentations are conducted.
